How it works?

According to the user's job description their need to know changes.

The information is identified and classified based on content, context and metadata aware policy rules.

Public

Secret

Top secret

Confidential

User sends an email or shares a classified file.

Role-based access control policies are enforced according to user's privileges over the information.

What RightsWATCH can do for you?

Increased Security

Fewer insider threat incidents

Increased visibility with audit trail

Protection extended to mobile

Improved Compliance

By taking decisions out of users' hands

Having forensics capabilities for tracking

Classifies legacy files

Increased Productivity

Familiar workflow with no extra steps

Flexible re-classification

Less time in training

Decreased Costs

Cost of damage to your brand

Cost of responding to incidents and auditing

Cost of training to increase user awareness

The leak or loss of information is a primary concern for every organisation today. Without doubt the number one priority has now become securing the organisations most valuable information – i.e. its data. Watchful Software provides a way to keep sensitive information safe from security breaches that result from accidental or malicious disclosure. RightsWATCH dynamically classifies and labels information of all types and only allows users with authorisation and permission to use specific data regardless of where it resides.
